FINAL SYSTEM DEMONSTRATION SCRIPT AND SLIDE OUTLINE

This plan tells the story from the problem to the results and then demonstrates the key user journey live. Every member presents a part and answers questions on their own work. Planned length: about 15 minutes, followed by questions. Dress code: formal business attire for all members.

1. Slide Outline

Table 1: Slide outline and presenters

No.	Slide	Content	Presenter	Time
1	Title	TrackWIL: Work-Integrated Learning logbook tracking; Group 3; team names; GitHub link	Gedion Basson	0:30
2	The problem	Paper, PDF and email logbooks: lost documents, slow sign-offs, no live view of who is behind; who is affected	Gedion Basson	1:00
3	Aim and objectives	One aim and five objectives; research questions linked to them	Gedion Basson	1:00
4	What exists already	InPlace, Sonia Online, Mahara/PebblePad compared; the gap: account-free mentor verification plus monitoring	Dylan Shepard	1:00
5	Requirements and method	18 functional and 7 measurable non-functional requirements; Agile sprints aligned with the weekly submissions	Sihle Kayise	1:00
6	Design	Architecture diagram; ERD (5 tables); verification sequence diagram	Moegammad Green	1:30
7	Live demonstration	Switch to the browser (Section 4 below)	Moegammad Green and Gedion Basson	5:00
8	Testing and results	81 test cases, 80 passed, 1 blocked; automated suite; response times	Dylan Shepard	1:30
9	Defects found and fixed	DEF-01 forged session cookie and DEF-07 data in redirect responses (both critical), DEF-02 expired links, DEF-03 mobile layout: found, fixed, retested	Dylan Shepard	1:00
10	Conclusion and future work	Objectives achieved; limitations (synthetic data, usability not yet measured); future work	Sihle Kayise	1:00
11	Team and Git evidence	Each member's role and contribution; branches and pull requests	All members	0:30
12	Questions	Thank you; questions	All members	—

2. Opening

Gedion Basson introduces the team and the project: "We are Group 3 and we built TrackWIL, a web application that replaces paper and email WIL logbooks. Students record their daily work and keep their WIL documents for each placement, workplace mentors verify it from a link without needing an account, and coordinators and lecturers can see straight away who is on track and who is falling behind."

3. Problem, Objectives and Design

- **Problem (Gedion):** students wait for signed documents, documents are lost in email, and staff cannot see progress without chasing students.
- **Gap (Dylan):** existing placement and portfolio systems are broad and institution-configured; mentors usually need accounts.
- **Requirements and method (Sihle):** prioritised, testable requirements; four one-week sprints ending on each submission date.
- **Design (Moe):** a single Next.js application in three layers; SQLite database with five tables; the verification sequence with one-time tokens and transactions.

4. Live Demonstration Flow

Before the presentation: run npm run db:reset, start the application (npm run build, then npm start), open http://localhost:3000 in one normal window and one private window, and close every other application.

Table 2: Live demonstration steps and expected results

Step	Action	Expected result	Presenter
1	Sign in as student2@ctucareer.co.za / student123 and open WIL 1	Sihle's WIL 1 logbook opens: "6 of 200 verified hours completed", the MOU uploaded and the other documents Missing, one entry Pending verification	Moe
2	Upload a PDF as the Commencement Letter	The Commencement Letter shows Uploaded; uploading a file that is not a PDF or image is refused	Moe
3	Click New entry; enter today's date, a short description, 6 hours, mentor@host.co.za and attach a PDF	Entry is saved as Draft and opens	Moe
4	Try 30 hours on a second entry	Message: "Hours for one day cannot be more than 24."	Moe
5	On the saved entry, click Submit for verification, then Copy link	Status becomes Pending verification; the 7-day link is shown	Moe
6	Paste the link into the private window (no sign-in)	Mentor page shows the student, date, hours and description with Approve and Reject	Gedion
7	Click Approve	Confirmation; the entry is Verified	Gedion
8	Refresh the mentor link	"This link was already used (approved)."	Gedion

Step	Action	Expected result	Presenter
9	Back in the student window, open WIL 1	The entry shows Verified and the hours have increased to 12 of 200	Moe
10	Sign out; sign in as lecturer@ctucareer.co.za / lecturer123	Dashboard: Dylan On track, Moe Overdue, Sihle and Gedion Awaiting verification, Lerato WIL completed, with hours, pending counts and missing documents	Gedion
11	Click Sihle Kayise on the dashboard	Sihle's profile: WIL 1 with 12 of 200 verified hours, the documents (view only) and the logbook	Gedion
12	(If time) Open a student URL as the lecturer	Redirected back to the dashboard: access is role-based	Gedion
13	Sign out; sign in as student3@ctucareer.co.za / student123	Lerato's WIL 1 shows WIL completed (200 of 200) and is locked; the student is asked to add the next WIL placement	Moe

5. Testing Evidence

Dylan shows the Test Cases and Results workbook and the automated run (npm run test:system: 62 of 62 passed), explains the fixed defects with the before-and-after evidence, and shows the response-time table and the 375-pixel phone screenshots.

6. Conclusion

Sihle summarises: all eighteen functional requirements are met; six of the seven non-functional requirements are met; usability with real users still has to be measured once ethical permission is granted. Future work: mentor feedback, coordinator review of documents, notifications, mentor access to evidence and a hosted deployment.

7. Backup Plan

- **Recorded walkthrough:** the 3 to 5 minute screen recording submitted in Week 4 is downloaded to the laptop and to a USB drive.
- **Screenshots:** every demonstration screen is in 04_System_Design_and_Development/screenshots and in the slides.
- **Second laptop:** a second member's laptop has the repository cloned, npm install done and the build ready.
- **Data problems:** npm run db:reset restores the demonstration data in seconds.
- **No network needed:** the application and database run locally, so the demonstration does not depend on Wi-Fi.
